P#8 PingPong

by Lesson 8: Machine Learning - Features 20201127 이창현

Idea

PingPong has two motion, forehand, backhand, etc.

source: https://www.joongang.co.kr/article/25197735

Process

- Create a class called [ball]. Contains position, velocity, and gravity information
- Creates a ball in the ball class array when spacebar is pressed.
- Three different classes based on the information received from the Wreckerator
- 1. stop / 2. forehand / 3. backhand
- Change the ball's behavior when performing the appropriate action

Code (main)

```
105
       float x, y, z;
       float speedX, speedY, speedZ;
107
       float gravity;
108
109
       Ball(float speedX) {
110
         this.x = 0:
111
         this.v = -30:
112
         this.z = -150:
113
         this.speedX = speedX:
114
         this speedY = 0:
115
         this.speedZ = 10:
116
         this.gravity = 0.1;
117
118
119
       void update() {
120
         speedY += gravity;
121
         x += speedX:
122
         y += speedY;
123
         z += speedZ;
124
125
         // 탁구대와의 충돌 체크
126
         if (y > -5 \&\& y < 5 \&\& z > -137 \&\& z < 137) {
127
          // 충돌 발생 시 y 속도를 반대로 변경
128
           speedY = -speedY;
129
130
131
         if (z < -151 \&\& y < 0 \&\& y > -50 \&\& x > -76 \&\& x < 76) {
132
           speedX *= -1:
133
           speedZ *= -1;
134
135
136
137
       void display() {
138
         pushMatrix();
139
140
         translate(x, y, z);
141
142
         fill(255, 127, 0);
143
         noStroke():
144
         sphere(4);
145
146
         popMatrix();
147
148 }
```

```
void oscEvent(OscMessage m) {
      m.print();
      float outputValue = m.get(0).floatValue(); // output_1의 값
      if (outputValue == 1) {
        // 클래스 1에 해당하는 경우
74
        println("Class 1");
75
      } else if (outputValue == 2) {
        // 클래스 2에 해당하는 경우
        println("Class 2");
        // 마지막으로 생성된 공의 움직임
        if (balls.size() > 0) {
          Ball lastBall = balls.get(balls.size() - 1);
          if (lastBall.speedX > 0 && lastBall.speedY < 0) {</pre>
            // speedX가 양수이고 speedY가 음수인 경우
84
            lastBall.speedX *= -1;
            lastBall.speedZ *= -1:
86
 87
      } else if (outputValue == 3) {
89
        // 클래스 3에 해당하는 경우
90
        println("Class 3");
        // 마지막으로 생성된 공의 움직임
92
        if (balls.size() > 0) {
          Ball lastBall = balls.get(balls.size() - 1);
          if (lastBall.speedX < 0 && lastBall.speedY < 0) {</pre>
95
            // speedX가 음수이고 speedY가 음수인 경우
96
            lastBall.speedX *= -1;
97
            lastBall.speedZ *= -1;
98
99
100
101 }
```
